

DROPOUT

Dropout is a highly concentrated flocculant for clarifying swimming pools. It is safe to use with other pool chemicals and will not alter pool chemistry. Dropout causes fine suspended particles to flocculate into larger particles that settle onto the pool floor for removal with underwater pool vacuum systems.

DIRECTIONS:

For heavily contaminated/very cloudy pools:

Use 200 mL Dropout per 10'000L pool water

For routine maintenance:

Use 50 – 100 mL Dropout per 10'000L pool water

- Close filter system off from pool
- Apply Dropout directly to the pool, dispersing evenly around the pool
- Flocculation will begin immediately
- Allow a stable floc to form and settle to the pool floor for a few hours
- Vacuum floc to waste
- Turn filter system back on and circulate

FOR COMMERCIAL USE
